Real piano app tutorial

R.layout.activity_main { super.onCreate(savedInstanceState); These are: RelativeLayout – This list controls how other items are placed or displayed on the relativelayout screen. Message view – This item displays text. Users are not expected to interact with this item. The results of the calculation are displayed using TextView,EditText, a type of TextView that allows users to edit and change text. However, since the calculator allows only a set of static inputs, we set the corrective text to not be edited. When a user clicks on a number, we display the numbers in EditText.Button – this entry allows users to interact and should respond to clicks by the user. We use buttons for numbers and practitioners in the calculator. Creating a Calculator layout ls a bit long. This is due to the fact that we need to clearly define and meticulously position each button in the calculator. ส่วนน้อยด้านล่างเป็นไฟล์คำโครงสร้างactivity_mainแบบxml<layout><RelativeLayout xmlns:android= xmlns:tools= android:id=@+id/activity_main android:layout_width=match_parent android:layout_height=match_parent android:paddingbottom=@dimen/activity_vertical_margin android:paddingleft=@dimen/activity_horizontal_margin android:paddingright=@dimen/activity_horizontal_margin android:paddingtop=@dimen/activity_vertical_margin tools:context=com.sample.foo.samplecalculator.MainActivity><TextView android:id=@+id/infoTextView android:layout_width=match_parent android:layout_height=wrap_content android:layout_below=@id/infoTextView android:enabled=false android:gravity=bottom android:lines=2 android:maxlines=2 android:textsize=20sp></EditText><Button android:id=@+id/buttonSeven style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_below=@id/editTextView android:layout_toRightOf=@id/buttonEight android:text=8 android:textsize=20sp></Button><Button android:id=@+id/buttonNine style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_below=@id/editTextView android:layout_toRightOf=@id/buttonEight android:text=9 android:id=@+id/buttonNine style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_below=@id/editTextView style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_toRightOf=@id/buttonEight android:text=9 ></RelativeLayout></layout></RelativeLayout></layout></></Button android:id=@+id/buttonDot style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_below=@id/editTextView android:layout_toRightOf=@id/buttonEight android:text=. android:textsize=20sp></Button><Button android:id=@+id/buttonZero style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignRight=@id/buttonEight android:layout_below=@id/buttonTwo android:text=0 android:textsize=20sp></Button><Button android:id=@+id/buttonEqual style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignRight=@id/buttonNine android:layout_below=@id/buttonThree android:text>= android:textsize=20sp></Button><Button android:id=@+id/buttonDivide style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignTop=@id/buttonSix android:layout_toRightOf=@id/buttonSix android:text=/ android:textsize=20sp></Button><Button android:id=@+id/buttonMultiply style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignTop=@id/buttonSix android:layout_toRightOf=@id/buttonThree android:text=* android:textsize=20sp></Button><Button android:id=@+id/buttonAdd style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignRight=@id/buttonEqual android:layout_toRightOf=@id/buttonEqual android:text+= android:textsize=20sp></Button><Button android:id=@+id/buttonClear style=@style/Widget.AppCompat.Button.Borderless android:layout_width=wrap_content android:layout_height=wrap_content android:layout_alignRight=@id/buttonAdd android:layout_below=@id/buttonAdd android:layout_marginTop=@dimen/activity_vertical_margin android:text=C android:textsize=20sp></Button><เครื่องคิดเลขภายในเครื่องคิดเลขมีสองค่าค่าOne และ valueTwo ค่าเหล่านี้จะเก็บตัวเลขที่จะดำเนินการ Both values are doubled so that numbers with and without decimals can be stored. We set One to a special pair of NaN (not numbers) for reasons that are clearer below. Personal even value One = Double.NaN; Private couple fee Two; This simple calculator can be performed either by adding, subtraction, multiplication or division. Therefore, we define four static characters to represent these operations CURRENT_ACTION a static variable that proceeds as we intend to perform. Static PrivateAdditional part of character = "+CURRENT_ACTION; Finally, we use the DecimalFormat class to format the output of our calculator. The Decimal Format Builder allows to display up to ten decimal places = new decimal format (#####button management (numbers) whenever a user clicks a number (or a point). (0) binding.buttonZero.setOnClickListener(New View OnClickListener() { @Override Public Void on Click (View View) { binding.editText.setText(binding.editText.getText() + 0); } } Click management (worker). We want to do a pending calculation first. Therefore, we define how to calculate calculations. Within the calculation, if valueOne is the correct number, we read the valueTwo from editText and perform the current spooling. On the other hand, if valueOne is NaN, the One value will number in editText, private void calculation () { if(Double.isNaN(valueOne)) { valueTwo = Double CURRENT_ACTION CURRENT_ACTION.parseDouble(binding.editText.getText())toString(CURRENT_ACTION); Other if(CURRENT_ACTION == DIVISION) value One = this.valueOne / valueTwo; We call computeCalculation() first, then set CURRENT_ACTION as the selected provider, while for the provider "=" equals us to call computeCalculation() and then clear the contents of both valueOne and CURRENT_ACTION. binding.buttonAdd.setOnClickListener(New View OnClickListener() @Override public spaces . On click (view) { calculation (view) { CURRENT_ACTION = add;add;binding.infoTextView.setText(decimalFormat.format(valueOne @Override) ++); calculation(CURRENT_ACTION); Deleting binding.infoTextView.setText(decimalFormat.format(valueOne) +-@Override); calculation(CURRENT_ACTION); multipli @Override cation; calculation(CURRENT_ACTION); parts; binding.buttonEqual.setOnClickListener(New View OnClickListener){ @Override Public Void onClick(View view) { computeCalculation(CURRENT_ACTION); Congratulations! You have finished your simple calculator. Finally, if you run and use the above app, you will notice some possible areas of improvement, such as 1) click the operator when the editText is clear (i.e. without entering the previous number 2) as always, the complete source is available in github and you are free (nimo support) to edit and apply it to the contents of your heart Hola in the comments if you find this useful and/or want to recommend the app for future tutorial.
